

ANDRITZ POWERS UP GLOBAL DATA PROTECTION WITH DRUVA

“With Phoenix we gained data visibility while reducing costs and complexity, simplifying and reinforcing our entire data protection strategy.”

*Brian Bagwell,
Director of IT - North America, Andritz Inc.*

About Andritz

Andritz is a global supplier of systems and services for hydropower stations, the pulp and paper industry, the metalworking and steel industries, as well as for solid/liquid separation in the municipal and industrial sectors. Their business, employing over 25,000 employees scattered across 200 worldwide offices, consists of many different organizations as best-in-class companies are acquired to complement existing services.

According to Brian Bagwell, Director of IT for North America, “As a global company, anytime we talk about data, the first topic that comes up is data privacy - where is the data coming from and where is it going to reside.” This puts a great deal of pressure on the organization to understand where its data is at all times and ensure that it is sufficiently protected.

The Limitations of Legacy Solutions

The Andritz IT team is responsible for this very diverse, decentralized environment. The company’s offices range in size from less than ten to more than 200 people, and may only have one file server or dozens of any mixture of file, SQL and application servers. The IT team is geographically dispersed across multiple locations, but there are also some offices without any IT team members on site.

Challenges

- Concerns about regional data privacy and controls to address compliance issues
- Painfully complex tape management system, without sufficient IT staff for all offices
- Time-consuming daily manual processes just to confirm backups were taking place
- Issues with restore reliability and consistency
- Rising hardware storage costs
- No central visibility

Solution

- Druva Phoenix has provided Andritz with a way to remove their legacy tape system and centrally manage remote office data in the cloud

Results with Druva

- 200 offices around the world are now centrally managed with full visibility into physical and virtual server data backups and archives
- Cloud-native architecture providing better data access and improved disaster recovery
- Archival automation and full data lifecycle management removed tape dependencies
- Distributed cloud storage has ensured alignment with regional data residency policies

Andritz relied on a tape-based server backup solution, which meant that in some locations non-IT staff are the ones to make sure that tapes are changed, etc. Even routine tasks such as verifying that backups had occurred were time consuming; the company estimates that their IT team spent about 70 hours each month just for this activity. And without any onsite IT, related tasks, such as restoring data from tape, were even more complicated; it frequently took multiple tries to locate the correct tape and then talk the onsite employee through loading it, finding the necessary files and restoring them. Plus, in an environment with so many dependencies, all of those steps may be completed only to discover there was no backup up of a particular file from which to recover. Another objective was to provide better disaster recovery, as well as ensure that they could access their data from anywhere, something which they lacked with their existing tape-based data protection service.

Simple, Consolidated Data Protection with Druva Phoenix

As Phoenix was deployed, the Andritz team had to work around the limited network capacity in some office locations. By leveraging Phoenix's bandwidth throttling, they were able to restrict the amount of network used by backup processes, reducing business impact. They created different profiles for different offices based on availability and also configured multiple, independent schedules. As a result, backups automatically adjust to take advantage of times when business is closed, such as on weekends, and use more bandwidth during these times.

Andritz experienced the benefits of Phoenix immediately. They now have single-pane access to all server data across all of their dispersed locations. The Phoenix dashboard provides this unified view, plus granular management of data, making it an integral part of data protection at the company. According to Bagwell, "Phoenix gives us visibility into our data. If we can see it, we can manage it." Today, an IT admin spends only 30 minutes each day verifying that backups have completed as planned, and the dozens of hours saved each month on this one process are redirected into more strategic tasks.

"A file restore that previously may have taken a couple of hours, or even days, can now be completed in seconds."

About Druva

Druva is the leader in cloud data protection and information management, leveraging the public cloud to offer a single pane of glass to protect, preserve and discover information—dramatically increasing the availability and visibility of business critical information, while reducing the risk, cost and complexity of managing and protecting it.

Druva's award-winning solutions intelligently collect data, and unify backup, disaster recovery, archival and governance capabilities onto a single, optimized data set. As the industry's fastest growing data protection provider, Druva is trusted by over 4,000 global organizations and protects over 25 PB of data.
